

WHAT TO TELL THE PATIENT

Pharmacogenetics is the study of how a person's body breaks down and distributes medications that they are prescribed and taking.

Pharmacogenetic testing gives us a beautiful spreadsheet-like chart that shows us which drugs your body is programmed to be able to break down in the normal fashion and which drugs you will not be able to break down in normal fashion.

The outcome for you as a patient is the testing allows you to be matched up with the right drug with the right dosage based on your DNA instead of the "one size fits all" prescription that you would normally receive.
